BRIDGE WMS

The Complete Warehouse Solution

Courier

We understand the importance of seamless operations when it comes to managing your shipments, which is why our Bridge WMS integrates with most popular courier services. As soon as your sales order is picked and packed in Bridge WMS you can send the consignment through to your preferred courier by using your hand-held device within the despatch process, which will then print off a courier label and upload the consignment to the courier portal. A courier API integration will help save time and money, decrease lead time, and increase customer satisfaction.

Sales Orders to Couriers

With API integration Bridge WMS communicates directly with the courier's system over the internet using their web, services API. In order to engage the courier module a sales order can be processed on the desktop, then picked, packed on the scanner and finally the despatch process will submit the consignment to the courier.

Key Features:

- Uses web service API/FTP.
- Send despatch reports (or manifest).
- Automatically produce consignment labels.
- Tracking of consignments.
- Saves time & money.
- Despatch & notifications can be configured. to use the customer details.
- Prebooking.

Despatch

Most major courier and postal services can be incorporated into this module. The selection process for the method of despatch, all details can be sent to the courier from the HHD/desktop. From this moment the job is turned over to the courier for confirmation and collection.
